Project 1 TruckLearn WriteUp:

The intended audience for this site is anyone seeking to learn the basic parts of a truck and the necessary basic knowledge that can be used for repairing a car, buying a used car, and knowing what to look for, maintaining a used car. It really can be used every day, if you learn what is on this site you can look out at any car or truck and understand all the visible parts job and how they work. The physical site for interaction would be at home or at school if you wanted to learn the basic understanding of it all.

The project itself is a type to interact page that allows the user to quickly flip through the different parts of a car/truck and learn what each part does and why it exists and how it works. The project is made of images that contain the text needed and it also has the necessary images for the parts that it is describing.

The aesthetic approach I made was chosen because it makes for an easy site to navigate and program, I really had trouble doing too much with this project and needed to make it as simple as possible so that I don't spend time programming something that ends up being worse off for user experience. The idea was to give clear pictures that are of real truck parts that way it is easier to identify them in real life, using sketches or drawings would leave out a lot of texture and details and it would be less interesting to look at in my opinion.
